

12.4. EVIDENCE BASE:

Should AUXILIARY NURSE MIDWIVES insert and remove contraceptive implants?

Problem: Poor access to contraception

Option: Auxiliary nurse midwives inserting and removing contraceptive

implants

Comparison: Care delivered by other cadres or no care

Setting: Community/primary health care settings in LMICs with poor

access to health professionals

	CRITERIA	JUDGEMENT	EVIDENCE	COMMENTS AND QUERIES
BENEFITS & HARMS OF THE OPTIONS	Are the anticipated desirable effects large?	No Probably Uncertain Probably Yes Varies No yes	A systematic review (Polus 2012a) searched for studies that assessed the effects and safety of to planning delivery in low and middle income countries. Another systematic review searched for studies the effects of midlevel providers, including auxiliary nurses, in improving the delivery of health car 2012). However, neither of these reviews identified any studies that assessed the effects of using	idies that assessed re services (Lassi a auxiliary nurse

We are therefore unable to draw any codesirable or undesirable effects of this intervention. Indirect evidence: One of these reviews (Polus 2012a) identified two studies from the Philippine IUD insertion by auxiliary nurse midwives was compared with IUD insertion by doctors. These str	s and Turkey where udies show that the
	What is the certainty of the anticipated effects?	Very Low Moderate High No direct evidence □ □ □ □ □ □ □	use of auxiliary nurse midwives probably leads to little or no difference in expulsion rates, removarates (moderate certainty evidence). There may also be little or no difference in rates of unintender referral rates before and after IUD insertion (low certainty evidence). The studies did not assess prinsertion failure, and complications at insertion. Another systematic review (Oladapo 2012) assessed the effects of <u>lay health workers delivering in the lay health workers delivering in t</u>	ed pregnancies or in pain at insertion, njectable
	Are the desirable effects large relative to the undesirable effects?	No Probably Uncertain Probably Yes Varies no yes	 <u>contraceptives</u> to women of reproductive age. This review identified one study from Uganda in who DMPA from lay health workers using 'autodisable' syringes (it was not clear whether this was a C uncertain whether lay health workers delivering injectable contraceptives improves contraceptive safety and patient satisfaction because the quality of the evidence from this study is very low. 	Are the resources required small?	No Probably Uncertain Probably Yes Varies no yes □ □	Main resource requirements	
Ш			Resource Settings in which auxiliary nurse midwives already provide care	other
RESOURCE USE			Training Some training for auxiliary nurse midwives to insert and remove contraceptive implant	a
			Supervision and monitoring Regular supervision by senior midwife or doctor	
			Supplies Contraceptive implant, insertion equipment and local anaestheti disposal	c, sharps
			Referral Patients may need to go to a referral centre for removal difficulti	3 5

	CRITERIA	JUDGEMENT	EVIDENCE	COMMENTS AND QUERIES
	Is the incremental cost small relative to the benefits?	No Probably Uncertain Probably Yes Varies no yes	Uncertain as there is insufficient evidence on effectiveness	
ACCEPTABILITY	Is the option acceptable to most stakeholders?	No Probably Uncertain Probably Yes Varies no yes □ □ □ □	We are not aware of any systematic reviews that considered the acceptability of auxiliary nurse midwife interventions. We are therefore uncertain about the acceptability of this intervention to key stakeholders. Indirect evidence: A systematic review (Rashidian 2012) exploring factors that influence the success of doctor-nurse substitution suggests that the acceptability of this intervention to key stakeholders may be mixed: Nurses may be motivated to take on new tasks by increased recognition and job satisfaction (moderate certainty evidence) Doctors may welcome the contribution of nurses where it reduces doctors' workloads (moderate certainty evidence). They may welcome the transfer of certain repetitive tasks to nurses (e.g. pap smears) and nurses seem to be happy with these tasks However, a lack of clarity about nurse roles and responsibilities in relation to other health workers may be a challenge (low certainty evidence) A review of country case studies of task shifting for family planning (Polus 2012b), which mainly included LHW programmes, suggests that recipients appreciate the easy access that community-based or home-based provision of contraceptives provides and appreciate the use of female health workers in the delivery of contraceptives. However, the review also suggests that some health workers may introduce their own criteria when determining who should receive contraceptives, including criteria tied to the recipient's marital status and age. Other factors that may affect the uptake of the intervention are primarily tied to the contraceptives themselves rather than the use of specific types of health workers, including a lack of knowledge about different methods of contraception; religious and other beliefs regarding family planning; a fear of side effects, service fees; and a lack of support from husbands. Annex: page 33 (Glenton, Khanna 2012); page 43 (Rashidian 2012); page 63 (Polus 2012b)	
FEASIBILITY	Is the option feasible to implement?	No Probably Uncertain Probably Yes Varies no yes	The intervention requires very few supplies (contraceptive implants, insertion equipment, local anaesthetic). However, changes to drug supplies may be needed and the intervention is also likely to require changes to norms or regulations. Training, including in communication about family planning, and supervision is necessary. However, a review of country case studies of task shifting for family planning (Polus 2012b) suggests that <u>auxiliary nurses</u> lacked confidence in their skills, partly because they had insufficient opportunities to practice these skills in settings were demand was low. In addition, systematic reviews of lay health worker, nurse and midwife programmes suggest that sufficient training and supervision is often lacking (moderate certainty evidence) (Glenton, Colvin 2012, Rashidian 2012, Colvin 2012). Adequate referral to a higher level of care for further management may be neccessary if removal leads to complications.
